Assignment Session-1

Subject : SQL

Prepared by Om Vadiya

Q.1) Install MySQL or PostgreSQL on your system and create a new database named 'music_streaming_app' using the command line or GUI tool of your choice.

=>

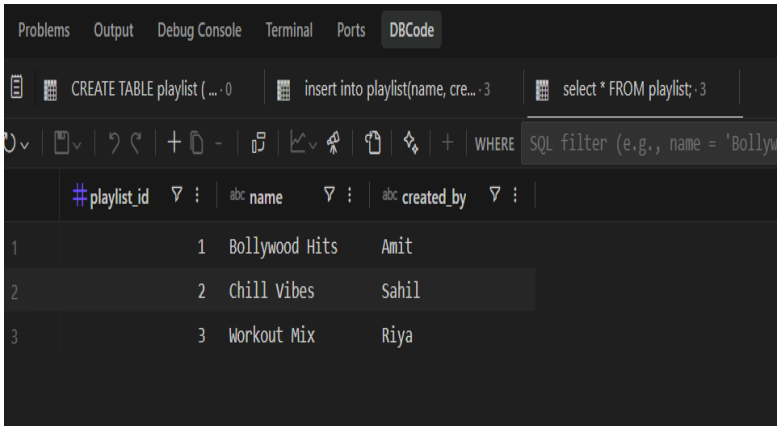

```
CREATE DATABASE music_streaming_app;
```

Q.2) Inside the 'music_streaming_app' database, create a table called 'playlists' with columns: playlist_id (integer, primary key), name (varchar), and created_by (varchar).

```
CREATE TABLE playlist
(
   playlist_id int AUTO_INCREMENT PRIMARY KEY,
   name varchar(30),
   created_by varchar(30)
);
```

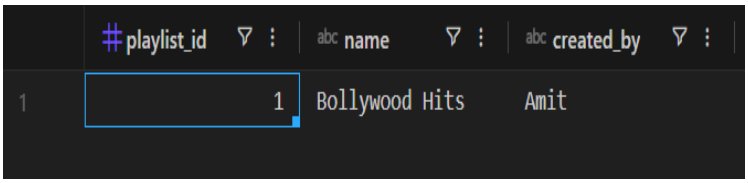

Q.3) Insert three sample rows into the 'playlists' table representing playlists like 'Bollywood Hits', 'Chill Vibes', and 'Workout Mix', each created by a different user.

```
insert into playlist (name, created_by) values
   ('Bollywood Hits', 'Amit'),
   ('Chill Vibes', 'Sahil'),
   ('Workout Mix', 'Riya');
```

Q.4) Write an SQL SELECT query to display all playlists created by the user 'Amit' from the 'playlists' table. Use the WHERE clause to filter by the 'created_by'

```
select * from playlist where
created_by='Amit';
```

	playlist_id	name	created_by
1	1	Bollywood Hits	Amit

Q.5) Open ChatGPT or Copilot and ask it to explain the difference between a table, a row, and a column in SQL using an example from a food delivery app like Zomato. Paste the explanation you receive into your assignment.

Concept	**Definition**	**Orientation**	**Zomato Example**	**Role in Database**
Table	A structured collection of related data organized into rows and columns, representing a specific entity.	The entire grid / dataset	The orders table (contains all order details across the app)	Groups all information related to a single subject (e.g., orders, restaurants, users).
Column (Field / Attribute)	A specific property or attribute that every record in	Vertical (↕)	restaurant_name, total_amount, order_status	Defines what kind of data can be stored

Concept	Definition	Orientation	Zomato Example	Role in Database
	the table possesses, defined with a data type (text, number, date).			for each record.
Row (Record / Tuple)	A single, complete entry containing values for each column for one specific instance.	Horizontal (↔)	(101, 'Pooja', 'Biryani Blues', 350.00, 'Delivered')	Represents one real-world event or object (e.g., one specific customer order).
