Assignment Session-2

Subject-: SQL

Vadiya Om
DATA SCIENCE

Q1) Install MySQL Community Server or SQLite on your system and verify the installation by connecting to the database using the command line or a GUI tool like MySQL Workbench or DB Browser for SQLite.

Q2) Create a new database named 'foodie_app' to simulate a Zomato-style backend.

```
CREATE DATABASE foodie_app;
```

Q3) Write a CREATE TABLE statement to define a 'restaurants' table in the 'foodie_app' database with the following columns: id (integer, primary key), name (varchar/character, max 100), cuisine (varchar/character, max 50), rating (decimal, e.g., 4.5), and location (varchar/character, max 100).

↓
.
.
↓

```
create table Restaurant (
    id int primary key,
    name varchar(100),
    cuisine varchar(50),
    rating float,
    location varchar(100)
);
```

Q4) Design and create a 'users' table for a Flipkart-style app with columns: user_id (primary key), username, email, phone_number, and created_at (date/time). Pick appropriate data types for each column. Think about which columns should be unique and which data types best fit email and phone numbers.

```
CREATE TABLE User (
    User_id INT PRIMARY KEY,
    User_name VARCHAR(50),
    Email VARCHAR(30) NOT NULL,
    Phone_number VARCHAR(10),
    Created_at DATE
);
```

Q5) Intentionally make a mistake in your CREATE TABLE statement (such as missing a comma or using an unsupported data type), run it, and then fix the error based on the message you receive. Take a screenshot of the error and the corrected SQL statement for your records.
